# Antennas Are Now Modeled

US Navy antenna test range, San Diego, California

- **Antenna modeling used to be the domain of scientists and engineers with very expensive antenna ranges covering acres and acres of land strewn with expensive equipment.**
- **Originally developed at Lawrence Livermore National Laboratory (LLNL) in the 1970s, the program *Numerical Electromagnetics Code* or *NEC*.**
- **The antenna design phase has been greatly improved and shortened with software tools now available.**
- **With the proliferation of personal computers and affordable (even free) software, antenna modeling has become a popular amateur activity.**

## Analyzing Antennas

### Solving Maxwell's Equations

- Electromagnetic field behavior is governed by Maxwell's equations
- Expressed in terms of fields (E, H) and sources (J, M)

$$\begin{aligned}\vec{\nabla} \times \vec{H} &= \vec{J}_v + \varepsilon \frac{d\vec{E}}{dt} \\ \vec{\nabla} \times \vec{E} &= -\vec{M}_v - \mu \frac{d\vec{H}}{dt} \\ \vec{\nabla} \cdot \vec{H} &= \frac{1}{\mu} \sigma_m \\ \vec{\nabla} \cdot \vec{E} &= \frac{1}{\varepsilon} \sigma_e\end{aligned}$$

Solving for Electric Field in terms of Vector Potential **A** which is obtained using Free Space Green's Function, **G**

$$\mathbf{E} = -j\omega\mu\mathbf{A} + \frac{1}{j\omega\varepsilon}\nabla(\nabla \cdot \mathbf{A})$$

$$\mathbf{E} = -j\omega\mu \int_V d\mathbf{r}' \mathbf{G}(\mathbf{r}, \mathbf{r}') \cdot \mathbf{J}(\mathbf{r}')$$

$$\mathbf{G}(\mathbf{r}, \mathbf{r}') = \frac{1}{4\pi} \left[ \mathbf{I} + \frac{\nabla\nabla}{k^2} \right] G(\mathbf{r}, \mathbf{r}')$$

**A** = Vector Potential  
**G** = Green's Function

# Why Model an Antenna?

- It's difficult to calculate, assemble, raise, adjust and optimize a physical antenna.
- It's difficult/time-consuming to measure the gain, radiation pattern, and efficiency of a real antenna.
- Antenna models can tell us much about efficiency, pattern, gain and input impedance.
- It's FAST - We can iterate through a lot of models and quickly focus on those that are the most useful.
  - Properly done, it very accurate
  - Improperly done, it can generate nonsense

# MMANA-GAL Modeling Software

Original code by JE3HHT - Makoto Mori

(MS Windows)

"MMANA-GAL basic is still free for Amateur Radio Use"

#### What Happened to the MMAMA Program?

MMANA has a new name, and will now be called MMANA-GAL - GAL is an united abbreviation of names of DL1PBD and DL2KQ. This reflects substantial structure changes to the program. Besides regular improvements, new improvements create the possibility of further improvements of capabilities and services available with the program.

MMANA-GAL is an antenna-analyzing tool based on the moment method, which was introduced in MININEC. The

**PRO version MMANA-GAL** professional antenna software  
English | Russian | Deutsch | Manual | Help | Ordering and Contact |

The PRO version MMANA-GAL is a new powerful Antenna-Analyzing Tool, which has been developed around the successful but [basic MMANA-GAL](#) engine. To maintain compatibility with existing files much of the original MMANA-Gal functionality has been incorporated into the new software. The PRO version has been specifically developed to handle very complex antenna designs. Some of the new features are ...>

## What It Does

You describe the antenna to the program.....

- Wire lengths, diameters, positions
- Source placement
- “Loads”, transformers, L networks
- Non-radiation transmission lines (incl. loss if desired)
- Ground

The program tells you

- Pattern: gain, front/back ratio
- Source impedances and SWR
- Load dissipation
- Currents
- Interaction with other antennas and conductors
- Antenna comparison

# Basic Procedure

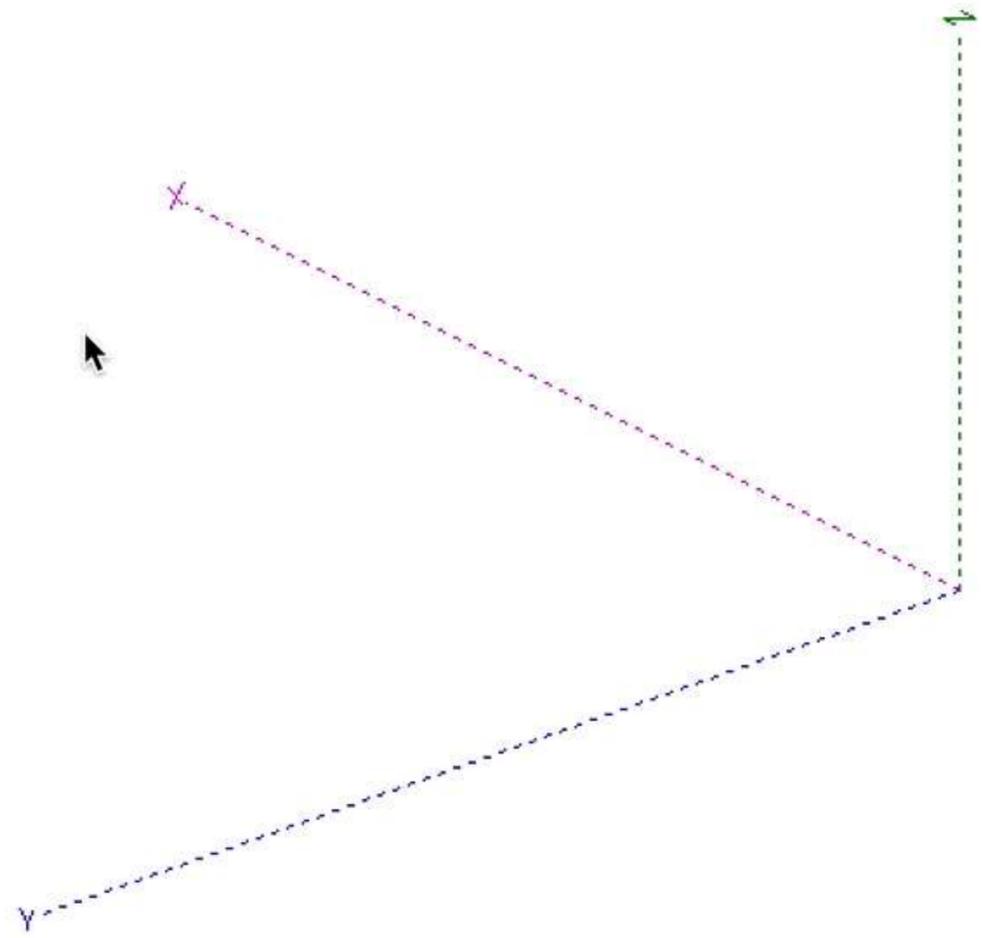

- **Geometry Tab**  
Name the antenna  
Set a Designed-For Frequency
- **Click the Wire Edit button to open the Wire Editor**  
Lay out the wires that make up the antenna  
Be mindful of the axis
- **Close the Wire Editor and go to the View Tab**  
Make sure it looks right  
Add a feed point by right clicking the wire and choosing Add Source
- **Go to the Calculate Tab**  
Set the Ground type (usually Real)  
Set the Material and Height  
Click the Start button to model the antenna
- **Click the Plots button on the Calculate tab or switch to the Far Field Plots tab to view the characteristics of the antenna**

Rotate around :  Selected wire  Middle point of antenna  X=0, Y=0, Z=H

# Practice the Familiar

- Start with “known-good” models
- Familiar antennas (dipoles, verticals, loops)
- Study beam basics (Yagis & phased arrays)
- Reproduce validated results
- Small changes in design should result in small changes in performance
- Add small features to “known-good” models

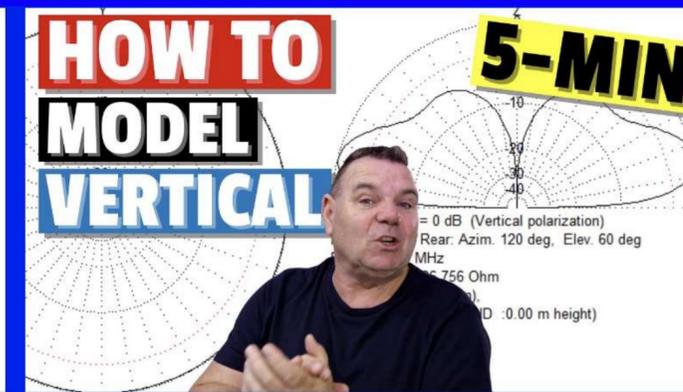

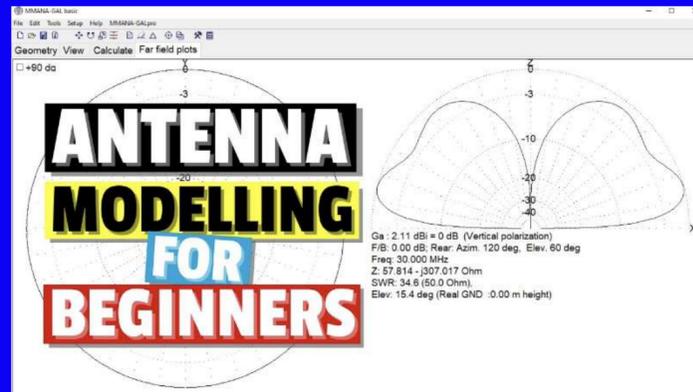

# Where to get MMANA-GAL Basic

- MMANA-GAL Basic version is free only for private, Non-commercial use
- Official Website <http://gal-ana.de>
- To get the basic version go to <http://gal-ana.de/basicmm/en/> and click on “Download”
- Select “Download MMANA-GAL basic version”
  
- User Group: <https://groups.io/g/mmana-gal>
- Tutorials available on YouTube @ DX Commander  
[https://www.youtube.com/results?search\\_query=DX+Commander+MMANA-GAL](https://www.youtube.com/results?search_query=DX+Commander+MMANA-GAL)
- Quickstart guide: <http://gal-ana.de/basicmm/en/>

# The Prime Directive

**“Essentially, all models are wrong, but some are useful”**

**George Edward Pelham Box**  
**British Mathematician**  
**1919 - 2013**

“Since all models are wrong the scientist cannot obtain a "correct" one by excessive elaboration. On the contrary following William of Occam he should seek an economical description of natural phenomena. Just as the ability to devise simple but evocative models is the signature of the great scientist, so overelaboration and over-parameterization is often the mark of mediocrity.”
